

# Stock

## Part of the eProphet Back Office System

A Stock Control System that puts YOU in Control of your Stock.

### Overview

The eProphet Stock system provides inventory management tools necessary to maintain and control inventory in your restaurant. The Stock system enables you to accurately manage the diversified menu and supply needs of your restaurant for analysis, providing a business tool designed to optimise the utilisation and cost of inventory.

### Features

- > Ability to set up and maintain an extensive database of inventory items.
- > Stock Items can easily be changed from one supplier item to another without having to change multiple product items that are built from that Stock Item.
- > The eProphet Stock System can be integrated with many popular Point of Sale Register Systems, allowing you to download product item sales and analyse those sales against the actual usage of stock items.
- > Ability to set selling price point by date so that sales analysis calculations are based on multiple selling prices in a particular stat period.
- > Tools and reports that clearly show all supply movements in a selected month on a day by day basis with daily, weekly, progressive and month to date totals.
- > Customisable stock control that allows you to define what stock analysis is to be done when and where. Focus your stock control efforts on the areas that matter most to you.
- > An ordering system that offers the flexibility of Usage per 1000 units used and Build to method on an item by item basis. Usage per 1000 can be updated from any calculated stat period and altered easily to meet the needs of each item. Stock in transit is automatically added to stock counts so split orders do not affect ordering cycle.
- > Ability to roll into a new accounting period without having to close off previous period allowing for extended troubleshooting without affecting the Inventory control of the new trading period.
- > Inactive or redundant items are easily purged from the system by utilising a Stock Item Analysis feature. This feature will seek items with no stock movement and prompt the user to remove from the system in the format of a wizard.
- > Concise Inventory reports for analytical and cost control purposes.
- > Supplier invoices downloaded directly into the system via FTP (from participating suppliers). This results in accurate input and time saving reducing the need for valuable labour resources inputting statistical data.
- > Stock orders can be sent electronically via FTP to suppliers that support this facility.

### Benefits

**IMPROVED COST CONTROL.** The master file structures are designed to comply with today's diversified supply and inventory demands. Reports are clear and concise facilitating better analysis.

**REDUCED DATA INPUT.** Invoices are downloaded direct from suppliers and when combined with CFM and Handheld Inventory recording, manual data input is drastically minimised.

**SAVES YOU TIME.** Through reduced data input and further automation, more time can be allocated to driving the business from information rather than preparing this information.

**POWERFUL TROUBLESHOOTING.** System allows for better troubleshooting via more detailed reporting and the "DIS" display.

**ACCURATE QCR.** As your products 'for sale' are set up with recipes from supply items, food cost is calculated from the actual cost of recipe items and not a rounded generic result catering for all like items.

**ACCOUNTING EXPORT.** eProphet Stock transfers supplier invoice data directly to the Abcom Creditors accounting package. This eliminates double handling of supplier invoices at the store and administration.

**INVENTORY MOVEMENTS.** Comprehensive inventory movement reporting to identify stock needs and usage patterns.

**YIELD ITEMS.** eProphet Stock supports the setup of variable product yield stock items such as fries where analysis of sales volume to raw item usage is appropriate.

### Technical Aspects

#### Only available to eProphet users.

eProphet Stock internet enabled functionality requires an approved broadband internet connection.

The eProphet Stock system can be integrated with the optional eProphet Portable Digital Assistant (PDA) software package to eliminate manual stock take entry.

The eProphet Stock system can be upgraded to run the optional eProphet Central File Maintenance (CFM) system to greatly reduce stock and product item maintenance.
